A surprisingly simple way for students to master any subject--based on one of the world's most popular online courses and the bestselling book *A Mind for Numbers* and its wildly popular online companion course "Learning How to Learn" have empowered more than two million learners of all ages from around the world to master subjects that they once struggled with. Fans often wish they'd discovered these learning strategies earlier and ask how they can help their kids master these skills as well. Now in this new book for kids and teens, the authors reveal how to make the most of time spent studying. We all have the tools to learn what might not seem to come naturally to us at first--the secret is to understand how the brain works so we can unlock its power. This book explains:

Arguing that too many would-be reformers know nothing about the conflicting demands of teaching, Kennedy takes us into the controlled commotion of the classroom, revealing how painstakingly teachers plan their lessons, and how many different ways things go awry. She argues that pedagogical reform proposals that do not acknowledge all of the things teachers need to do are bound to fail. If reformers want students to learn, they must address all of the problems teachers face, not just those that interest them.

GO Math! offers an engaging and interactive approach to covering the Common Core State Standards. This Grade 5 student edition is organized into individual chapter booklets and comes with a student resource book.

Teachers who want an up-to-date, readable, and concise introduction to computers continue to turn to *Computer Education for Teachers*. This book discusses examples of discrete mathematics in school curricula, including in the areas of graph theory, recursion and discrete dynamical systems, combinatorics, logic, game theory, and the mathematics of fairness. In addition, it describes current discrete mathematics curriculum initiatives in several countries, and presents ongoing research, especially in the areas of combinatorial reasoning and the affective dimension of learning discrete mathematics. Discrete mathematics is the math of our time.' So declared the immediate past president of the National Council of Teachers of Mathematics, John Dossey, in 1991. Nearly 30 years later that statement is still true, although the news has not yet fully reached school mathematics curricula. Nevertheless, much valuable work has been done, and continues to be done. This volume reports on some of that work. It provides a glimpse of the state of the art in learning and teaching discrete mathematics around the world, and it makes the case once again that discrete mathematics is indeed mathematics for our time, even more so today in our digital age, and it should be included in the core curricula of all countries for all students.

A fourth grade mathematics curriculum based on the Common core standards (c. 2010) and designed for use in Florida schools.

Mr. Christy gathered the vocabulary for MR GO over a five-year period. He analyzed most of the state tests available to him and pulled many of the vocabulary words from these tests. That is the reason that if you learn all the words in MR GO, you will not only pass any state test but will possibly score high on the test.

The book presents a selection of the most relevant talks given at the 21st MAVI conference, held at the Politecnico di Milano. The first section is dedicated to classroom practices and beliefs regarding those practices, taking a look at prospective or practicing teachers' views of different practices such as decision-making, the roles of explanations, problem-solving, patterning, and the use of play. Of major interest to MAVI participants is the relationship between teachers' professed beliefs and classroom practice, aspects that provide the focus of the second section. Three papers deal with teacher change, which is notoriously difficult, even when the teachers themselves are interested in changing their practice. In turn, the book's third section centers on the undercurrents of teaching and learning mathematics, which can surface in various situations, causing tensions and inconsistencies. The last section of this book takes a look at emerging themes in affect-related research, with a particular focus on attitudes towards assessment. The book offers a valuable resource for all teachers and researchers working in this area.
