This book presents the current state of research on the basic scientific aspects of root canal biofilm biology within a clinically applicable context. Root canal biofilms are complex polymicrobial structures adhering to the root canal surface that are formed by microorganisms invading the pulpal space of teeth, and are associated with persistent root canal infections. Concerted efforts to study root canal biofilms have been made in the past decade, resulting in the publication of observational and experimental studies that detail the morphology and biology of these structures in infected root canals. In addition to confirming that bacteria in root canals do not exist in free-floating planktonic states as previously assumed, this new information on root canal biofilm infections has provided an opportunity to re-evaluate conventional clinical protocols and improve endodontic therapeutic measures.

This book is designed to help dentists in general practice to improve the results of prosthetic procedures in medically compromised and elderly patients. In particular, it critically scrutinizes various dogmas that govern practitioners' approaches yet lack sound scientific support and often have an adverse effect on outcomes. Attention is drawn to straightforward procedures that offer significant clinical benefits and to aspects that are too often neglected, such as the impact of systemic diseases. New light is cast, for example, on the taking of dental impressions, the treatment of malocclusions, the making of jaw relation records, the relationship between denture quality and patient satisfaction, and the use of implant-supported overdentures versus traditional complete prostheses (dentures). As Albert Einstein once said, "It is what we think we know that prevents us from learning more." Readers will find that this book helps them to re-examine taken-for-granted elements of their practice, leading to improved care and patient satisfaction.

A revolutionary, personalized guide to preventing heart disease based on genetic factors Heart disease is the #1 cause of death in America. It affects 81 million Americans and is the culprit in one of every two deaths in the United States. Most people think that they are not at risk of a heart attack if they control their cholesterol and blood pressure, but they aren't aware of other major risk factors. The good news is that with the right information and strategies, heart attacks are preventable--even if heart disease runs in the family. In Beat the Heart Attack Gene, world-renowned cardiovascular specialists Bradley Bale, MD and Amy Doneen, ARNP, present a new model for understanding and preventing heart disease. They explain the three different genetic types of cholesterol profiles and tailor treatments for each type, using their cutting-edge Bale/Doneen Method, a simple, comprehensive prevention plan that detects cardiovascular disease (CVD) at early stages. Beat the Heart Attack Gene includes easy quizzes and self-tests that show how to determine cholesterol genotype as well as advice for how to apply that knowledge through nutritional and lifestyle changes.
