Heart failure has been traditionally explained as a reduction in cardiac pumping capacity, caused by problems in the blood. Till now the therapy prescribed has been symptomatic, involving the use of diuretics, muscular stimulation and blood vessel relaxants. But recent research has focussed on the circumstances leading up to heart failure, which includes abnormal hemodynamics, atherosclerosis, dietary and nutritional anomalies, obesity, immunity and other metabolic disorders. This book brings together such research in one volume, including molecular and cellular aspects of heart failure and its pathophysiology. It is a significant contribution to the understanding and prevention of heart failure, and will be welcomed by cardiologists, pharmacologists, biochemists, and all those who practice and research the subject. The contributors from around the world include Australia, Brazil, Canada, Denmark, India, and USA.

This book discusses recent developments in several laboratories studying leishmaniasis. Sequencing of the human genome, as well as of the leishmania genome, has led to significant advances in our understanding of host-immune responses against leishmania, and mechanisms of infection-induced pathology, which is responsible for morbidity and mortality. Pathogenesis of Leishmaniasis focuses on the latest basic research into leishmaniasis, but also addresses how advances in understanding can be applied to prevention, control and treatment of what the WHO has classified a neglected tropical disease.

This book strengthens the scientific knowledge base and promotes rational thinking among students The Medical Council of India (MCI) has introduced a competency-based curriculum in 2019, which not only lays emphasis on integration with clinical and pre-clinical subjects but also clearly states subject competencies and defines domains and levels to be achieved for each of them. " . . . the motto for the therapeutics of the future will have to be de sedibus et causis pharmacorum. " P. EHRLICH, 1909 Exciting events in the basic disciplines of virology, immunology, and pharmacology continue to advance the understanding of the pathogenesis and control of virus diseases. At the same time, the rational development of antiviral agents is attracting, to an increasing extent, the interest of workers in other disciplines. Improvements in technology facilitate the definition of potential target sites for antiviral intervention and unmask new viral and host genes. The outcome is a further steady development of new antiviral agents which approach the "magic bullets" first proposed by PAUL EHRLICH. Remarkable advances in protein synthetic methods that yield polypeptides which inhibit active sites of viral proteins have aided substantially in the basic and clinical study of these antiviral agents. In addition, the extremely rapid progression in recombinant DNA techniques, leading to the synthesis of large quantities of gene products, is also increasing our opportunities at a dashing pace. New information and developing technology facilitate research on the mechanism of action, toxicity, pharmacokinetics, and pharmacodynamics of new agents. The list of clinically effective antiviral agents is expanding and the number of potentially useful compounds is growing rapidly. This book is a combined theoretical text and practical manual which, it is hoped, will be of use to all who have an interest in virus diseases, particularly scientists, physicians and graduate students.
