Everyone can impact the supply chain Supply Chain Management For Dummies helps you connect the dots between things like purchasing, logistics, and operations to see how the big picture is affected by seemingly isolated inefficiencies. Your business is a system, made of many moving parts that must synchronize to most efficiently meet the needs of your customers—and your shareholders. Interruptions in one area ripple throughout the entire operation, disrupting the careful coordination that makes businesses successful; that's where supply chain management (SCM) comes in. SCM means different things to different people, and many different models exist to meet the needs of different industries. This book focuses on the broadly-applicable Supply Chain Operations Reference (SCOR) Model: Plan, Source, Make, Deliver, Return, and Enable, to describe the basic techniques and key concepts that keep businesses running smoothly. Whether you're in sales, HR, or product development, the decisions you make every day can impact the supply chain. This book shows you how to factor broader impact into your decision making process based on your place in the system. Improve processes by determining your metrics Choose the right software and implement appropriate automation Evaluate and mitigate risks at all steps in the supply chain Help your business function as a system to more effectively meet customer needs We tend to think of the supply chain as suppliers, logistics, and warehousing—but it's so much more than that. Every single person in your organization, from the mailroom to the C-suite, can work to enhance or hinder the flow. Supply Chain Management For Dummies shows you what you need to know to make sure your impact leads to positive outcomes. The study aims to determine [hypothesis] whether the procurement strategies chosen by the ODA (Olympic Delivery Authority) are the right choice for delivering the two main venues in the Olympic Park in time, on budget and to the required quality. In order to answer this question, the approach of this study is to undertake extensive research in the subject area of construction procurement and to identify best practice in making procurement decisions for a project. In particular, the procurement strategies chosen by the ODA will be researched and their shortcomings identified. Based on this theoretical framework, the author will be able to undertake a systematic analysis of the decisions made by the ODA to procure the two most prestigious venues in the Olympic Park. As a main part of this analysis the author will conduct semi- structured interviews with key people involved in the Olympics and with experts of ?the industry. Both the literature review and the interviews will help to achieve the main research objectives of this study, which are summarised below:

- Obtain a better understanding of construction procurement and the key areas affecting the project success
- Identify best practice in selecting a procurement method and to make out the

pitfalls and the shortcomings of the procurement strategies that are used for both venues • Understand why these procurement decisions were made and identify if best practice was followed by the ODA during its procurement process and if the pitfalls of the chosen strategies were counteracted • Determine if the chosen procurement strategies fit the client & the project

Corruption presents a fundamental threat to the stability and prosperity of Mexico and combating it demands approaches that are both principled and practical. In 2017, the Inter-American Development Bank (IDB) approved project ME-T1351 to support Mexico in its fight against corruption using Open Innovation. Thus, the IDB partnered with the Governance Lab at NYU to support Mexico's Secretariat of Public Service (Secretaría de la Función Pública) to identify innovative solutions for the measurement, detection, and prevention of corruption in Mexico using the GovLab's open innovation methodology named Smarter Crowdsourcing. The purpose of Smarter Crowdsourcing was to identify concrete solutions that include the use of data analysis and technology to tackle corruption in the public sector. Although written at the behest of and for the Mexican context, the recommendations and plans for their implementation developed in this report could be adapted for use in other countries. This document contains 13 implementation plans laying out practical ways to address corruption. The plans emerged from "Smarter Crowdsourcing Anti-Corruption" (2017). The Smarter Crowdsourcing method is an agile process, which begins with robust problem definition followed by online sourcing of global expertise to surface innovative ideas and then turns them into practical implementation plans.

The end of the Cold War left the U.S. with a surplus of weapons-grade plutonium, which poses proliferation and safety risks. Much of this material is found in a key nuclear weapon component known as a pit. The DoE plans to dispose of at least 34 metric tons of plutonium by fabricating it into mixed oxide (MOX) fuel for domestic nuclear reactors. To do so, two facilities are being constructed -- a MOX Fuel Fabrication Facility and a Waste Solidification Building. This report assessed the: (1) cost and schedule status of the construction projects; (2) status of NNSA's plans for pit disassembly and conversion; (3) status of NNSA's plans to obtain customers for MOX fuel; and (4) actions to provide independent nuclear safety oversight. Inhaltsangabe:Introduction: 1.1 Subject and background: The global economic situation by its ever-changing business dynamics, such as ambiguities about the market, fierce competition, consumer behaviour and their changing preferences significantly increases Business Management responsibilities. Today as never before people are concerned with the environment and social issues; rapidly rising oil prices, increasing transparency and consumer interest in how products are made and where they come from, pressures Business Managers to create a more transparent and sustainable industry. Especially Purchasing Managers play a key role in using their procurement function to foster sustainable development. Referring to an international study that was carried out by Capgemini Consulting, sustainability efforts constitute the second important business driver on multiple supply chain agendas for 2010

(Haarman et al., 2009). Companies are rapidly adopting the term into their business or corporate social responsibility (CSR) reports. However, a review of the literature will show that the term sustainability has been inconsistently defined. More specifically, most of the recent sustainability research has examined issues such as environment, human rights and safety in a standalone fashion (Seuring et al., 2008). Especially Purchasing Managers fail to take the emerged challenge of sustainability into a more integrative perspective: They often limit their purchasing policies on environmental considerations only. More precisely, there does not appear to be a corporate strategy that integrates environmental and social issues together into one purchasing plan. Hence, the sustainability challenges pressures Purchasing Managers to take the effect of their purchasing actions on the triple bottom line (TBL) into account, which refers to people, planet and profit.

1.2 Reason for choice of subject: The clothing and textile industry is massive. It is worth over US\$1trillion worldwide, and contributes to 7% of world exports and employs nearly 26 million people (Tokatli, 2007). Paying a greater attention to fashion retailers, the high street dynamic pushed the retail prices for clothing extremely down. Sadly, consumers are demanding more of low price clothing and consequently fashion becomes more and more disposable. In lieu thereof silent sounds approach mainstream retailers; sounds from degrading working conditions in manufacturing facilities and threatening environmental [...]

Big data is a term that describes the large volume of data – both structured and unstructured – that inundates a business on a day-to-day basis. But it's not the amount of data that's important. It's what organizations do with the data that matters. Big data can be analyzed for insights that lead to better decisions and strategic business moves. The use of Big Data is becoming common these days by the companies to outperform their peers. In most industries, existing competitors and new entrants alike will use the strategies resulting from the analyzed data to compete, innovate and capture value. Big Data helps the organizations to create new growth opportunities and entirely new categories of companies that can combine and analyze industry data. These companies have ample information about the products and services, buyers and suppliers, consumer preferences that can be captured and analyzed. While the term "big data" is relatively new, the act of gathering and storing large amounts of information for eventual analysis is ages old. The concept gained momentum in the early 2000s when industry analyst Doug Laney articulated the now-mainstream definition of big data as the three Vs: Volume. Organizations collect data from a variety of sources, including business transactions, social media and information from sensor or machine-to-machine data. In the past, storing it would've been a problem – but new technologies (such as Hadoop) have eased

the burden. The name 'Big Data' itself is related to a size which is enormous. Size of data plays very crucial role in determining value out of data. Also, whether a particular data can actually be considered as a Big Data or not, is dependent upon volume of data. Hence, 'Volume' is one characteristic which needs to be considered while dealing with 'Big Data'. Velocity. Data streams in at an unprecedented speed and must be dealt with in a timely manner. RFID tags, sensors and smart metering are driving the need to deal with torrents of data in near-real time. The term 'velocity' refers to the speed of generation of data. How fast the data is generated and processed to meet the demands, determines real potential in the data. Big Data Velocity deals with the speed at which data flows in from sources like business processes, application logs, networks and social media sites, sensors, Mobile devices, etc. The flow of data is massive and continuous. Variety. Data comes in all types of formats – from structured datasets numeric data in traditional databases to unstructured text documents, email, video, audio, stock ticker data and financial transactions. Variety refers to heterogeneous sources and the nature of data, both structured and unstructured. During earlier days, spreadsheets and databases were the only sources of data considered by most of the applications. Now days, data in the form of emails, photos, videos, monitoring devices, PDFs, audio, etc. is also being considered in the analysis applications. This variety of unstructured data poses certain issues for storage, mining and analysing data.

The approach used on a given spend item should largely depend on the balance between supply power and demand power. That is the logic behind the bestselling Purchasing Chessboard®, used by hundreds of corporations worldwide to reduce costs and increase value with suppliers. The 64 squares in the Purchasing Chessboard provide a rich reservoir of methods that can be applied either individually or combined. And because many of these methods are not customarily used by procurement, the Purchasing Chessboard is also the perfect tool for helping buyers to think and act outside the box and find new solutions. A well-proven concept that works across all industries and all categories in any given situation, it is little wonder that business leaders and procurement professionals alike are excited by, and enjoy strategizing around, the Purchasing Chessboard. This second edition of The Purchasing Chessboard addresses the new realities of a highly volatile economic environment and describes the many—sometimes surprising—ways in which the Purchasing Chessboard is being used in today's business world. Yet despite all of the great achievements of procurement executives and their teams, they do not always receive the recognition they deserve. In response, the authors have developed and outlined within the book an unequivocal approach to measure procurement's impact on a company's performance—Return on Supply Management Assets (ROSMA®).
