In 1577 a Jesuit priest named Matteo Ricci set out from Italy on a long journey to bring the Christian faith and Western thought to Ming dynasty China. He spent time in India and Macao before entering China in 1583 to undertake mission work. Travelling widely, Ricci learned local languages, mastered Chinese classical script, drew the first-ever

map of the world in Chinese and acquired a rich appreciation of the indigenous culture of his hosts. In 1596 Ricci wrote a short book in Chinese on the art of memory for the governor of Jiangxi province, who was preparing his three sons for China's demanding civil service examinations. In it he described a 'memory palace' in which to hold knowledge such as might help the three brothers and their peers in the Ming social elite to pass their exams with flying colours. Ricci must have hoped that, in gratitude to him for instructing them in mnemonic skills, they would use their newly won prestige to further the cause of the Catholic Church in China. To capture the complex emotional and religious drama of Ricci's life, author Jonathan Spence relates the missionary's experiences via a series of images. Four of these images derive from events described in the Bible, the others from Ricci's book on the art of memory that was circulated among members of the Ming dynasty elite. A rich and compelling narrative about a remarkable life, *The Memory Palace of Matteo Ricci* is also a significant work of global history, juxtaposing the world of Counter-Reformation Europe with that of Ming China. The old saying goes, "To the man with a hammer, everything looks like a nail." But anyone who has done any kind of project knows a hammer often isn't enough. The quality of your outcomes depends on the mental models in your head. And most people are going through life with little more than a hammer. Until now. *The Great Mental Models*:

Other segments offer a journalistic history of the human relationship with memory, addressing its failings, its successes, and its limitations. Most people operate according to a series of misconceptions about human memory. Above all, many believe that they have an average brain and are therefore incapable of performing mental feats such as swiftly memorizing a deck of playing cards shuffled into random order. This belief, however, is false. Memory champions are no smarter than anyone else and have unremarkable brains from a biological standpoint.

The difference is in how memory champions use their brain. They employ techniques and training to overcome shortcomings that are hard-wired into the human brain anatomy. Even those who appear to possess a photographic memory likely do not and are instead employing other memorization techniques... Educational practice does not, for the most part, rely on research findings. Instead, there's a preference for relying on our intuitions about what's best for learning. But relying on intuition may be a bad idea for teachers and learners alike. This accessible guide helps teachers to integrate effective, research-backed strategies for learning into their classroom practice. The book explores exactly what constitutes good evidence for effective learning and teaching strategies, how to make evidence-based judgments instead of relying on intuition, and how to apply findings from cognitive psychology directly to the classroom. Including real-life examples and case studies, FAQs, and a wealth of engaging illustrations to explain complex concepts and emphasize key points, the book is divided into four parts: Evidence-based education and the science of learning Basics of human cognitive processes Strategies for effective learning Tips for students, teachers, and parents. Written by "The Learning Scientists" and fully illustrated by Oliver Caviglioli, *Understanding How We Learn* is a rejuvenating and fresh examination of cognitive psychology's application to education. This is an essential read for all teachers and educational practitioners, designed to convey the concepts of research to the reality of a teacher's classroom.

but will last for life, and unwrap the puzzle of maths forever. The key to confidence with numbers is not remembering complex rules surrounding long division or algebra; it's understanding the critical components of maths and being able to clearly visualise problems and solutions. This illuminating guide to improving your maths provides logical, long-term strategies that will enable you to finally get maths and hold on to that level of confidence thereafter.

This book examines the nature and causal antecedents of superior memory performance. The main theme is that such performance may depend on either specific memory techniques or natural superiority in the efficiency of one or more memory processes. Chapter 2 surveys current views about the structure of memory and discusses whether common processes can be identified which might underlie general variation in memory ability, or whether distinct memory subsystems exist, the efficiency of which varies independently of each other. Chapter 3 provides a comprehensive survey of existing evidence on superior memory performance. It examines techniques which underlie many examples of unusual memory performance, and concludes that not all this evidence is explicable in terms of such techniques. Relations between memory ability and other cognitive processes are also discussed. The remainder of the book describes the authors' own studies of a dozen memory experts, employing a wide

variety of short- and long-term memory tasks. These studies provide a much larger body of data than previously available from studies of single individuals, usually restricted to a narrow range of tasks and rarely involving any systematic study of long-term retention. The authors argue that in some cases unusual memory ability is not dependent on the use of special techniques. They develop some objective criteria for distinguishing between subjects who demonstrate "natural" superiority and those "strategists" who depend on techniques. Natural superiority was characterised by superior performance on a wider range of tasks and better long-term retention. The existence of a general memory ability was further supported by a factor analysis of data from all subjects, omitting those who described highly-practised techniques. This analysis also demonstrated the independence of initial encoding and retention processes. The monograph raises many interesting questions concerning the existence and nature of individual differences in memory ability (a previously neglected topic), their relation to other cognitive processes and implications for theories concerning the structure of memory.
